Justification for the Use Case Diagram

System: Credit Purchase Management System

1. Analysis and Justification of Actors and Use Cases

Actors

Salesperson: Initiates the sales process and assists the customer with credit purchases within the system.

Customer: The end user requesting credit and interacting with the purchase flow.

Credit Dep Rep (Credit Department Representative): Validates, reviews, and manages credit authorizations and requests.

Courier: Manages the logistics and physical delivery phase associated with the purchase.

Use Cases

Use Case (General/Main): Represents the core process of handling a credit purchase transaction.Request Credit: Allows the customer or salesperson to submit a formal credit application for review.Automatic Payments: Handles recurring or automated payment processing linked to the account.Delivery: Manages the shipping and fulfillment tracking handled by the courier.Credit Authorization: Evaluates and approves or rejects the credit terms requested by the user.

2. Justification of Relationships

Actor-to-Use Case Associations: Solid lines connecting actors to their specific functionalities, defining who triggers each process (e.g., Salesperson and Customer interacting with Request Credit, Courier managing Delivery).Include Relationships (<<include>>): Dashed arrows indicating mandatory functional dependencies, ensuring that core processes like Credit Purchase automatically invoke supporting operations such as credit checks, payment processing, or delivery scheduling.

3. Conclusion: The diagram effectively illustrates how users interact with the system, although the underlying logic can vary depending on interpretation; for instance, one might add the bank that processes the automatic payment, but—as I said—it depends on the logic applied and how it is represented in the diagram.
